

Figure 1. A schematic diagram illustrating the experimental design. The figure shows a sequence of events starting from "Random assignment to treatment groups". This leads to two parallel paths: one labeled "Control group" and another labeled "Treatment group". Both groups proceed through three stages: "Baseline assessment", "Intervention period", and "Post-intervention assessment". The "Intervention period" for the treatment group includes a box labeled "Cognitive-behavioral therapy (CBT)". Arrows indicate the flow of time and progression through these stages for both groups.
